Abstracts

Hot Cell is a closed workspace with high radiation shielding and special environmental control capabilities. It is mainly used to handle highly radioactive materials or perform operations in highly radioactive environments. It isolates the internal high-radioactive area from the external environment through thick shielding materials (such as lead, concrete, etc.) to prevent leakage of radioactive rays and protect the safety of operators and the environment. At the same time, the hot cell is equipped with special mechanical operating equipment (such as manipulators, remote control devices, etc.) so that operators can remotely operate the radioactive materials in the hot cell through the control system in the external safe area to complete various experiments, processing, and handling tasks. In addition, the hot cell also has environmental adjustment systems such as ventilation, purification, temperature and humidity control to ensure the stability and suitability of the internal working environment and meet the needs of different radioactive operations.

The global Hot Cell market size was estimated at USD 115.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.30% during the forecast period.
