### Report Overview:

Hot-dip galvanization is a form of galvanization. It is the process of coating iron and steel with a layer of zinc by immersing the metal in a bath of molten zinc at a temperature of around 840 °F (449 °C). When exposed to the atmosphere, the pure zinc (Zn) reacts with oxygen (O<sub>2</sub>) to form zinc oxide (ZnO), which further reacts with carbon dioxide (CO<sub>2</sub>) to form zinc carbonate (ZnCO<sub>3</sub>), a usually dull grey, fairly strong material that protects the steel underneath from further corrosion in many circumstances. Galvanized steel is widely used in applications where corrosion resistance is needed without the cost of stainless steel, and can be identified by the crystallization patterning on the surface (often called a "spangle").

The Global Hot-dip Galvanizing Market Size was estimated at USD 772.61 million in 2023 and is projected to reach USD 1108.42 million by 2029, exhibiting a CAGR of 6.20% during the forecast period.
