Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Hot Induction Bend competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Hot induction bend is a process that uses electromagnetic induction heating technology to locally heat the pipe and then bend it into shape. This technology uses a high-frequency induction coil to generate eddy current heating in the local area of the pipe, softening the material at high temperature, and then bending it into the required angle through mechanical external force, and finally cooling it quickly to shape. Compared with traditional cold bending or flame heating pipe bending, thermal induction pipe bending has the advantages of high precision, high efficiency, uniform wall thickness, and low residual stress. It is widely used in high-pressure and high-temperature pipeline systems in the fields of petroleum, natural gas, chemical industry, and electric power.

The global Hot Induction Bend market size was estimated at USD 1359.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.30% during the forecast period.
