Abstracts

Extrusion is the process of changing the physical properties of a substance by forcing it through an orifice or die under controlled conditions. For example, a rotating screw forces feed material forward toward the die, where the material is softened by frictional heat generated by the barrel wall. The feed material arrives at the end of the screw in a viscous state and can then be forced through an orifice (or die) and molded into the desired shape. Industrial granulators are machines that are used in several industry verticals to reduce the size of particles of materials. Rapidly increasing industrialization around the world is also projected to favour shipments of Hot Melt Extrusion Granulator in the future. The launch of new construction projects in light of surging demand for infrastructure development is also positively impacting market development around the world, especially in developing countries. Hot Melt Extrusion Granulator sales are also forecasted to rise owing to the high focus on sustainability, which is driving demand for the recycling of almost all products.
