Abstracts

Hot Melts for Solar Panels refer to thermoplastic adhesive materials used during the manufacturing and encapsulation of photovoltaic (PV) modules. These adhesives, typically in the form of EVA (ethylene-vinyl acetate) or POE (polyolefin elastomer) films or compounds, are activated by heat and pressure during the lamination process to bind various solar cell layers together. They offer critical functions including sealing, moisture resistance, electrical insulation, and optical transparency. Hot melts help ensure long-term durability and performance of solar panels under harsh outdoor conditions. With the rise of bifacial and high-efficiency modules, demand for advanced hot-melt encapsulants with low shrinkage, UV resistance, and PID resistance has significantly increased.

The global Hot Melts for Solar Panels market size was estimated at USD 340.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.70% during the forecast period.
