Abstracts

Hot rolled dual phase steel is a type of advanced high-strength steel (AHSS) characterized by a microstructure consisting primarily of a soft ferrite matrix with dispersed islands of hard martensite, produced through controlled thermomechanical processing during hot rolling. This microstructure imparts a unique combination of high strength, excellent formability, good fatigue resistance, and enhanced energy absorption, making it particularly suitable for automotive applications where weight reduction, crash performance, and fuel efficiency are critical. Unlike conventional high-strength low-alloy (HSLA) steels, dual phase steels exhibit continuous yielding, low yield-to-tensile strength ratios, and high work hardening rates, which allow for better part forming and improved dent resistance. The material is commonly used in structural and safety components such as bumper beams, cross members, door intrusion beams, and wheel discs, and it is increasingly favored in the automotive industry due to stricter emission regulations and the ongoing shift toward lightweight vehicle design.

The global Hot Rolled Dual Phase Steel market size was estimated at USD 18500.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.80% during the forecast period.
