Report Overview

An air fryer is a kitchen appliance that cooks by circulating hot air around the food using the convection mechanism. It is a smaller version of the convection oven. A mechanical fan circulates the hot air around the food at high speed, cooking the food and producing a crispy layer via the browning reactions of caramelization and the Maillard reaction. The Maillard reaction requires temperatures of between 280-330°F (140-165°C), while caramelization temperatures depend on the sugar being caramelized and range from 230-360°F (110-180°C).
