Abstracts

Human papillomavirus (HPV) decontamination systems are specialized devices and protocols designed to eliminate or reduce the presence of HPV on surfaces and in the environment, particularly in healthcare settings, public spaces, and high-touch areas where viral transmission is a concern. These systems typically employ advanced disinfection technologies such as ultraviolet (UV) light, hydrogen peroxide vapor, or other chemical agents proven effective against non-enveloped viruses like HPV. The primary goal is to mitigate the risk of fomite transmission, complementing traditional cleaning methods by targeting residual viral particles that may persist on equipment, furniture, or instruments. As HPV is known for its environmental stability and association with various cancers and genital warts, the demand for reliable decontamination solutions has grown, especially in gynecology clinics, dermatology practices, sexual health facilities, and other environments where exposure risks are elevated. The efficacy of these systems often depends on factors such as contact time, intensity of the disinfecting agent, and the nature of the surface being treated, with regulatory standards and clinical validation playing key roles in their adoption and trustworthiness.

The global Hpv Decontamination Systems market size was estimated at USD 352.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.75% during the forecast period.
