Abstracts

Low-density lipoprotein (LDL) is derived from very low-density lipoprotein (VLDL). Its main function is to transport cholesterol to cells throughout the body and to the liver to synthesize bile acid. It can be used to study receptor-mediated endocytosis, especially in diseases such as atherosclerosis. Plasma-derived LDL can be used to study the oxidation of LDL in function and metabolism. Acetylated LDL is a type of modified LDL. LDL contains unmodified apolipoproteins and can be used to study the transport and endocytosis of normal cholesterol. When the lysine residues of LDL apolipoproteins are acetylated, the LDL complex no longer binds to the LDL receptor, but the modified LDL is more likely to bind to the "scavenger" receptors of endothelial cells and microglial neurons. Therefore, Ac-LDL can be used to study the functions of the above cells.

The global Human Acetylated Low Density Lipoprotein market size was estimated at USD 74.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.00% during the forecast period.
