Abstracts

Human genome sequencing is the comprehensive process of determining the complete DNA sequence of a human genome, which involves identifying and mapping all the base pairs that make up an individual's genetic code; it utilizes advanced technologies such as next-generation sequencing (NGS) to decode, analyze, and interpret genetic information for applications in diagnostics, personalized medicine, ancestry tracing, and research into genetic disorders, mutations, and hereditary traits. The market for human genome sequencing is driven by declining costs, technological advancements in sequencing accuracy and speed, increasing adoption in clinical settings for precision medicine, growing investment in genomics research by both public and private sectors, and rising consumer interest in direct-to-consumer genetic testing services. Key players in the market include Illumina, Thermo Fisher Scientific, BGI, Pacific Biosciences, and Oxford Nanopore Technologies, while the market faces challenges such as data privacy concerns, ethical considerations, the need for robust bioinformatics infrastructure, and regulatory hurdles in different regions. Despite these challenges, the market is poised for significant growth, fueled by expanding applications in oncology, rare disease diagnosis, pharmacogenomics, and population-scale genomics initiatives, with North America currently leading in market share due to strong research funding and healthcare infrastructure, followed by Europe and the Asia-Pacific region, where increasing healthcare expenditure and government support are accelerating adoption.

The global Human Genome Sequencing market size was estimated at USD 138.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 18.50% during the forecast period.
