Abstracts

Hyperimmune Globulin is a highly concentrated immunoglobulin containing high levels of specific antibodies used for passive immunotherapy. It is usually extracted from the plasma of recovered patients who have been infected with a specific pathogen, so these people have produced high levels of antibodies against the pathogen. Hyperimmune globulin is similar to intravenous immunoglobulin (IVIG) except that it is prepared from the plasma of donors with high titers of antibody against a specific organism or antigen. Some agents against which hyperimmune globulins are available include hepatitis B, rabies, tetanus toxin, varicella-zoster, etc. Administration of hyperimmune globulin provides "passive" immunity to the patient against an agent. This is in contrast to vaccines that provide "active" immunity. However, vaccines take much longer to achieve that purpose while hyperimmune globulin provides instant "passive" short-lived immunity. Hyperimmune globulin may have serious side effects, thus usage is taken very seriously. The human plasma-based hyperimmune preparation market is driven by the increasing demand for effective treatments against specific infectious diseases and other medical conditions. Hyperimmune preparations are derived from the plasma of individuals who have recovered from a particular infection or have been vaccinated against a specific pathogen. These preparations contain high levels of antibodies targeting the specific pathogen or antigen, making them valuable for passive immunization in individuals at risk or currently affected by the same disease. The growing prevalence of infectious diseases, such as COVID-19, and the need for rapid and targeted therapeutic solutions have fueled market growth. Moreover, advancements in plasma fractionation and purification technologies have improved the production and safety of hyperimmune preparations. However, the market also faces challenges, including the complexity of large-scale plasma collection and processing, ensuring consistent antibody levels in the preparations, and maintaining a robust supply chain to meet demand during disease outbreaks or pandemics. Additionally, regulatory

considerations and the need for stringent safety and quality standards are crucial challenges for manufacturers. To succeed in this market, companies must focus on research and development to expand the applications of hyperimmune preparations, collaborate with healthcare authorities and organizations to establish guidelines and protocols, and work towards enhancing plasma collection infrastructure to ensure a steady supply of human plasma-based hyperimmune preparations for critical therapeutic interventions.

The global Human Hyperimmune Globulins market size was estimated at USD 2207.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.40% during the forecast period.
