Abstracts

An infrared thermometer is a thermometer which infers temperature from a portion of the thermal radiation sometimes called black-body radiation emitted by the object being measured. They are sometimes called laser thermometers as a laser is used to help aim the thermometer, or non-contact thermometers or temperature guns, to describe the device's ability to measure temperature from a distance. By knowing the amount of infrared energy emitted by the object and its emissivity, the object's temperature can often be determined within a certain range of its actual temperature. Infrared thermometers are a subset of devices known as "thermal radiation thermometers". Human Infrared Thermometer measures body temperature from 35.0 to 42.0°C without contact. The primary reasons anticipated to drive the market are an increase in the prevalence of infectious diseases and other medical problems, including malaria and dengue, as well as growing public awareness of the significance of body temperature monitoring.
