Abstracts

The human iNOS ELISA kit is a commonly used tool in biomedical and life science research. It employs the enzyme-linked immunosorbent assay (ELISA) technique, based on the principle of specific antigen-antibody binding, and is specifically designed for the quantitative detection of inducible nitric oxide synthase (iNOS) levels in human samples such as serum, plasma, and cell culture supernatants. Through specific reactions with iNOS in the sample and enzyme-labeled antibodies or antigens, the iNOS content in the sample is finally determined by methods such as colorimetry or fluorescence.

The global Human iNOS ELISA Kits market size was estimated at USD 65.7 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.80% during the forecast period.
