Abstracts

Human Interleukin 2 (IL-2) is a cytokine produced by activated T cells that plays a critical role in regulating immune responses, primarily by promoting the proliferation, differentiation, and survival of T lymphocytes, natural killer cells, and B cells. It functions through binding to high-affinity receptors on the surface of target immune cells, initiating intracellular signaling pathways that modulate both innate and adaptive immunity. IL-2 has significant therapeutic applications, particularly in oncology, where recombinant IL-2 (such as aldesleukin) is used as an immunotherapy for metastatic renal cell carcinoma and melanoma due to its ability to stimulate anti-tumor immune activity. Additionally, its immunomodulatory properties are being explored in autoimmune diseases, transplant rejection, and as an adjuvant in vaccine development, though its clinical use is often limited by toxicity and pleiotropic effects that can either enhance or suppress immune function depending on context and dosage.

The global Human Interleukin 2 (IL 2) market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
