Abstracts

Human internal organ models are anatomical representations of the human body's internal structures, designed for educational, medical, and scientific purposes. These models range from simplistic, single-organ replicas used in basic biology classes to highly detailed, multi-system models employed in medical training, patient education, and clinical demonstrations. They are typically crafted from materials such as plastic, silicone, or resin to mimic the texture, color, and structural accuracy of real organs, with some advanced versions featuring removable parts, cross-sections, or pathological conditions to illustrate diseases or surgical procedures. The primary function of these models is to provide a tangible, visual aid that enhances understanding of human anatomy, supports diagnostic explanation, and facilitates hands-on learning in environments where real human specimens are impractical or ethically constrained.

The global Human Internal Organ Model market size was estimated at USD 125.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.80% during the forecast period.
