Abstracts

A human-mouse chimeric antibody is a type of monoclonal antibody engineered by combining the variable regions of a mouse antibody (which determines antigen specificity) with the constant regions of a human antibody. This design reduces immunogenicity in humans compared to fully murine antibodies, while retaining the mouse antibody's ability to bind its target. Chimeric antibodies are typically around 65–70% human and are used in the treatment of cancers, autoimmune diseases, and transplant rejection.

The global Human-mouse Chimeric Antibody market size was estimated at USD 21452.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.20% during the forecast period.
