Abstracts

Human Normal Immunoglobulin (HNIG) refers to a sterile solution containing concentrated antibodies derived from pooled human plasma, specifically immunoglobulin G (IgG), which is used for passive immunization to provide immediate, short-term protection against various infections and immune deficiencies. It is administered intravenously (IVIG) or subcutaneously (SCIG) and functions by supplementing or replacing natural antibodies in patients who have impaired immune systems, such as those with primary immunodeficiency disorders, secondary immunodeficiencies, or certain autoimmune and inflammatory conditions. The product is rigorously processed to ensure pathogen safety, including viral inactivation and removal steps, and is standardized to contain a broad spectrum of IgG antibodies reflective of the general population's immune response, making it a critical therapeutic agent in immunology and infectious disease management.
