Abstracts

Human Osteopontin ELISA Kit is an in vitro diagnostic immunoassay kit designed for the quantitative detection of osteopontin (OPN), a multifunctional phosphorylated glycoprotein, in human biological samples such as serum, plasma, cell culture supernatants, and other bodily fluids. These kits utilize enzyme-linked immunosorbent assay (ELISA) technology, typically employing a sandwich format with specific monoclonal or polyclonal antibodies coated onto microplate wells, enabling the precise measurement of OPN concentrations. The product is primarily used in research settings—including cancer biology, immunology, bone metabolism studies, and inflammatory disease investigations—as well as in clinical diagnostics for biomarker analysis, given osteopontin's roles in cell adhesion, migration, signaling, and its association with pathological conditions such as tumor progression, osteoporosis, and cardiovascular diseases. Key features often include high sensitivity, specificity, reproducibility, and a standardized protocol compatible with most laboratory equipment, making it an essential tool for both academic and industrial researchers focused on understanding OPN's biological and clinical significance.

The global Human Osteopontin Elisa Kit market size was estimated at USD 180.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.45% during the forecast period.
