Abstracts

A placenta is an organ that connects the developing fetus to the uterine wall to allow nutrient uptake, thermo-regulation, waste elimination, and gas exchange through the mothers blood supply. In addition, it aids in fighting against internal infection and produces hormones to support pregnancy. This placenta is further hydrolyzed and is used for a variety of applications as it has lactogenic, luteotropic, and growth-promoting action, and prevents maternal insulin action during pregnancy. Skin Care Products are expected to dominate the global human placental protein market in the forecast period. This can be attributed to the rising prevalence of cosmetics products among the targeted population and the increasing number of menopause population. As the placenta connects developing fetus to the uterine wall to all nutrients uptake, thermoregulation, fighting against internal infection and produce hormones to support pregnancy, which makes placenta protein highly nutritious and thus it further hydrolyzed and use it for many skincare products and hair care treatments. In addition, with the increasing aging population worldwide, the human placental protein extract has been extensively used for anti-aging therapy and is promoting the growth of the overall market.

The global Human Placental Protein market size was estimated at USD 1076.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 10.00% during the forecast period.
