Report Overview

Human Rabies Immunoglobulin (HRIG) intramuscular (IM) is a biological product derived from human plasma containing high levels of rabies virus-neutralizing antibodies. It is administered as part of post-exposure prophylaxis (PEP) to individuals who have been exposed to the rabies virus, particularly in cases of severe bites or scratches from potentially rabid animals. HRIG works by providing immediate passive immunity to neutralize the virus before the body can produce its own antibodies in response to rabies vaccination. The product is critical in regions where rabies is endemic, serving as a life-saving intervention when administered promptly after exposure. Given its plasma-derived nature, HRIG undergoes rigorous screening and purification processes to ensure safety, efficacy, and compliance with global regulatory standards, such as those set by the WHO and FDA. Its use is typically guided by strict medical protocols, often in conjunction with rabies vaccines, to maximize protection against the fatal disease.

The global Human Rabies Immunoglobulin IM market size was estimated at USD 434.83 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.26% during the forecast period.
