Report Overview
The human vision sensors are Dynamic Vision sensors which work same as the human retina. The human vision sensors work on the principle of the capturing the scene ‘at the time they occur.
The popularity of the human vision sensors is increasing due to the fact that the captured data is in the continuous form, on the other hand, the conventional vision sensors capture the scenes in the form of series of frames. These frames consist of a large amount of data in the form of images and other scenes. This information results in the wastage of the RAM, memory access, energy, time, computational power and the disk place to store the information.
