Report Overview

Humanized Monoclonal Antibody is a type of antibody engineered to closely resemble human antibodies while retaining the specificity of a non-human source. This process involves modifying a monoclonal antibody, originally derived from animal sources (often mice), by grafting its variable regions onto a human antibody framework. The result is an antibody that can effectively target specific antigens while minimizing the risk of immune reactions against the antibody itself, making it safer and more effective for therapeutic use in humans, such as in the treatment of various diseases including cancer and autoimmune disorders.

The global Humanized Monoclonal Antibody market size was estimated at USD 8561 million in 2023 and is projected to reach USD 22988.06 million by 2032, exhibiting a CAGR of 11.60% during the forecast period.
