Abstracts

A humeral head prosthesis is a medical device used in shoulder arthroplasty to replace the damaged or diseased humeral head—the ball-shaped top of the upper arm bone that articulates with the glenoid socket of the scapula to form the glenohumeral joint. These implants are typically indicated for conditions such as severe osteoarthritis, rheumatoid arthritis, post-traumatic arthritis, avascular necrosis, or complex proximal humerus fractures that cannot be effectively managed with conservative treatment or fracture fixation. Prostheses may be designed as hemiarthroplasty (replacing only the humeral head), total shoulder arthroplasty (replacing both the humeral head and glenoid), or reverse total shoulder arthroplasty, which inverts the ball-and-socket mechanics to improve function in cases with rotator cuff deficiency. Constructed from biocompatible materials like cobalt-chromium alloys, titanium, or highly cross-linked polyethylene, modern humeral head prostheses often feature modular components, porous coatings for bone ingrowth, and anatomic or platform stem designs to optimize fixation, restore biomechanics, and accommodate future revisions. The prosthesis aims to alleviate pain, restore range of motion, and improve shoulder function, with design evolution increasingly focused on patient-specific instrumentation, minimally invasive techniques, and long-term durability.

The global Humeral Head Prostheses market size was estimated at USD 615.73 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
