Abstracts

Hybrid cochlear implants are advanced medical devices designed to provide a combination of electrical and acoustic stimulation for individuals with high-frequency hearing loss but preserved low-frequency hearing. These systems integrate a cochlear implant component, which electrically stimulates the auditory nerve for high-frequency sounds, with an acoustic hearing aid component that amplifies low-frequency sounds, offering a more natural auditory experience and improved speech understanding in noisy environments compared to traditional cochlear implants or hearing aids alone.

The global Hybrid Cochlear Implant market size was estimated at USD 685.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.50% during the forecast period.
