## Report Overview:

Cooling towers are devices that help in heat transfer and rejection into the atmosphere. The process involves the cooling of a water stream via evaporation. A small portion of the water that is being cooled gets evaporated and flows along with the air stream, which enables the process water to be cooled significantly. Hybrid cooling towers effectively radiate heat from the process equipment in major industries, such as the power generation industry, and emit it into the surrounding atmosphere. Unlike traditional cooling towers, hybrid ones take care of the visible plume and arrest it before rejecting it from the towers.

The Global Hybrid Cooling Towers Market Size was estimated at USD 1002.14 million in 2023 and is projected to reach USD 1231.88 million by 2029, exhibiting a CAGR of 3.50% during the forecast period.
