Abstracts

A Hybrid Fiber Coaxial (HFC) network is a telecommunications infrastructure that combines optical fiber and coaxial cable technologies to deliver high-bandwidth services, such as broadband internet, cable television, and digital telephony, to end-users. In this architecture, fiber optic cables run from the service provider's central office to neighborhood nodes, ensuring high-speed, low-loss data transmission over long distances, while coaxial cables connect from these nodes to individual homes and businesses, leveraging their durability and cost-effectiveness for the "last mile" of distribution. This hybrid approach optimizes performance by utilizing the strengths of both mediums: fiber provides scalability and bandwidth for backbone connectivity, while coaxial cable supports efficient signal delivery to multiple endpoints, making HFC a widely adopted solution in modern broadband and multi-service networks.

The global Hybrid Fiber Coaxial Network market size was estimated at USD 12750.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.85% during the forecast period.
