Abstracts

A fuel pump is a component used to extract fuel from a fuel tank and pressurize it to deliver it to the engine, ensuring the fuel pressure required for the normal operation of the engine. A hybrid fuel pump usually refers to a fuel pump that can adapt to multiple fuel types (such as gasoline, diesel, biofuel, etc.) or has multiple working modes. This type of fuel pump is flexible in design and can be adjusted according to different fuel characteristics and engine requirements to ensure optimal fuel supply and engine performance. The continued growth of the global automotive market has provided a broad market space for hybrid fuel pumps. As consumers' requirements for automobile performance, comfort and environmental protection continue to increase, the market demand for hybrid fuel pumps, as a key component to improve fuel efficiency and reduce emissions, is also increasing. The rapid development of new energy vehicles has put forward new demands on hybrid fuel pumps. Although new energy vehicles mainly rely on electric drive, hybrid vehicles still have certain market advantages in some specific scenarios (such as long-distance driving or areas with imperfect charging facilities). Therefore, the application prospects of hybrid fuel pumps in hybrid vehicles are broad.

The global Hybrid Fuel Pump market size was estimated at USD 1620.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 14.30% during the forecast period.
