Abstracts

Hybrid magnetic bearings represent an advanced category of active magnetic bearings that combine both permanent magnets and electromagnets to achieve stable levitation and precise control of rotating machinery, eliminating physical contact and thereby minimizing friction, wear, and the need for lubrication. By integrating permanent magnets to provide static bias flux and electromagnets for dynamic control, these systems offer higher efficiency, reduced power consumption, and enhanced reliability compared to purely electromagnetic or passive magnetic designs, making them particularly suited for demanding applications such as high-speed turbomachinery, precision manufacturing equipment, energy storage systems like flywheels, and specialized aerospace components where operational longevity, minimal maintenance, and vibration control are critical.

The global Hybrid Magnetic Bearing market size was estimated at USD 850.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
