## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Hybrid Solid Electrolytes competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Hybrid Solid Electrolytes are composite materials that combine inorganic solid electrolytes (such as oxides, sulfides, or phosphates) with organic polymer-based electrolytes to form a solid-state ion-conducting medium. These materials aim to leverage the high ionic conductivity and mechanical stability of inorganic components with the flexibility and interfacial compatibility of polymers. Hybrid solid electrolytes are primarily developed for next-generation solid-state batteries, where they serve as safer, non-flammable alternatives to liquid electrolytes, and help suppress dendrite formation when paired with lithium-metal anodes. Typical combinations include  $\text{Li}_2\text{La}_2\text{Zr}_2\text{O}_{12}$  (LLZO) or  $\text{Li}_6\text{GeP}_4\text{S}_{13}$  (LGPS) mixed with polyethylene oxide (PEO) or polyacrylonitrile (PAN). They offer improved mechanical integrity, processability, and ionic conductivity, making them a promising solution for electric vehicle batteries, consumer electronics, and grid storage applications.

The global Hybrid Solid Electrolytes market size was estimated at USD 327.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.70% during the forecast period.
