Abstracts

Hybrid solid state lidar (SSL) represents a technological evolution in light detection and ranging systems, combining elements of both mechanical and solid-state designs to balance performance, reliability, and cost-effectiveness. Unlike fully mechanical systems that rely on rotating parts, hybrid SSL typically employs a limited set of moving components?such as microelectromechanical systems (MEMS) mirrors or rotating prisms?alongside solid-state elements like optical phased arrays or flash illumination, enabling wider fields of view and higher resolution than pure solid-state alternatives while offering greater durability and scalability than traditional mechanical lidar. This intermediate architecture allows hybrid SSL to deliver robust 3D sensing capabilities suitable for applications requiring a balance of precision, environmental resilience, and affordability.

The global Hybrid Solid State Lidar market size was estimated at USD 1050.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 18.50% during the forecast period.
