Abstracts

Hybridization system refers to a method or process used in molecular biology to study and analyze the interactions between nucleic acids (such as DNA or RNA) or between nucleic acids and other molecules. In this system, two complementary nucleic acid strands are allowed to come together and form a stable hybrid, or double-stranded structure. This hybridization can occur between two DNA strands, two RNA strands, or between a DNA and RNA strand. The hybridization process is typically carried out by heating the nucleic acid strands to denature or separate them, and then cooling them to allow reannealing or hybridization to occur. The stability and specificity of the hybridization are determined by the degree of complementarity between the nucleic acid strands. Hybridization systems are widely used in various molecular biology techniques, such as DNA microarray analysis, polymerase chain reaction (PCR), Southern blotting, and Northern blotting. These techniques allow researchers to detect and quantify specific nucleic acid sequences, study gene expression patterns, identify genetic variations, and investigate molecular interactions.

The global Hybridization System market size was estimated at USD 13360.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.20% during the forecast period.
