## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Hydrant Isolation Valve competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Hydrant Isolation Valve is an isolation valve used to separate the fire main pipe section arranged in the machine room equipped with the main fire pump or pump set from the other parts of the fire main pipe. It is usually installed outside the machine room (such as the engine room), generally on the main deck, so that it can still be operated in case of a fire in the engine room. The main function of this valve is to isolate the fire-fighting water on the deck and in the engine room. It is usually kept open, allowing the ship to supply fire-fighting water through the main fire pump, emergency fire pump and international shore connection. In an emergency, closing the isolation valve can prevent fire water from flowing back into the engine room or being discharged out of the ship through the suction port of the engine room fire pump. At the same time, it ensures that fire hydrants in other areas can be supplied with water from the shore through emergency fire pumps or international shore-based connectors, guaranteeing the fire-fighting capacity of the entire ship.

The global Hydrant Isolation Valve market size was estimated at USD 440.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.20% during the forecast period.
