Abstracts

Hydraulic climbing formwork is a specialized construction system used primarily in the construction of high-rise buildings, bridges, and other large-scale vertical structures, characterized by its self-climbing capability driven by hydraulic or electric mechanisms that allow the formwork to ascend vertically without the need for cranes or external lifting equipment at each stage. This system typically consists of large panels, a climbing frame, working platforms, and integrated safety features, enabling efficient, cycle-based concrete pouring for core walls, shear walls, and other repetitive vertical elements while improving construction speed, safety, and labor efficiency compared to traditional formwork methods.

The global Hydraulic Climbing Formwork market size was estimated at USD 950.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.10% during the forecast period.
