Report Overview:

Hydraulic Cylinders is a kind of hydraulic actuator which converts hydraulic energy into mechanical energy and makes linear reciprocating motion (or swing motion). It is simple in structure and reliable in operation. When it is used to realize reciprocating motion, it can avoid decelerating device, and has no transmission clearance, so it is widely used in various mechanical hydraulic systems. The output force of the hydraulic cylinder is directly proportional to the effective area of the piston and the pressure difference on both sides; the hydraulic cylinder is basically composed of cylinder barrel and cylinder head, piston and piston rod, sealing device, buffer device and exhaust device. Buffer and exhaust devices depend on the specific application, other devices are essential.

The Global Hydraulic Cylinders Market Size was estimated at USD 6007.18 million in 2023 and is projected to reach USD 8235.96 million by 2029, exhibiting a CAGR of 5.40% during the forecast period.
