Abstracts

Hydraulic gear wheel pumps are positive displacement pumps that utilize the meshing action of two gears to generate fluid flow, where one gear (the driver) is powered by an external source such as an electric motor or internal combustion engine, and the other (the driven gear) rotates in response, creating a vacuum at the inlet side that draws hydraulic fluid into the pump cavity; as the gears continue to rotate, the fluid is transported around the outside of the gears within the housing and forced out under pressure at the discharge side, making these pumps valued for their simplicity, durability, cost-effectiveness, and suitability for medium-pressure applications across industries like construction, agriculture, manufacturing, and automotive systems.

The global Hydraulic Gear Wheel Pump market size was estimated at USD 2450.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
