Abstracts

A hydraulic lock-up clutch is a component used in automatic transmissions, primarily in torque converters, to mechanically lock the turbine and impeller together once a certain speed is achieved, eliminating slippage and improving fuel efficiency by creating a direct drive connection between the engine and transmission. It operates using hydraulic pressure controlled by the transmission control unit, which engages or disengages the clutch based on driving conditions such as vehicle speed, throttle position, and load. This mechanism enhances overall drivetrain efficiency, reduces heat generation, and contributes to smoother shifting and better performance in modern automotive systems.

The global Hydraulic Lock Up Clutch market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
