Report Overview

The hydraulic ram pump is a mechanical device that utilizes the power of flowing water to pump a portion of it to a higher elevation without the need for external power sources. It operates on the principle of water hammer effect, where the force generated by a sudden flow stoppage is used to pump water. The pump consists of a drive pipe, a delivery pipe, and a valve system. When water flows through the drive pipe and abruptly stops due to the closing of a valve, the energy is transferred to the delivery pipe, causing a pressure difference that lifts a portion of the water to a higher elevation. Hydraulic ram pumps are commonly used in remote areas or off-grid locations for water supply, irrigation, and livestock watering, as they offer a simple, low-cost, and energy-efficient solution.
