Abstracts

A hydraulic spring is a device that uses compressed liquid as an elastic medium to achieve a spring effect. It usually consists of a closed container, a compressible liquid, and a sealed piston. When an external force acts on the hydraulic spring, the piston is compressed, the liquid is squeezed, and a reaction force is generated, thereby achieving the function of the spring. With the continuous development of industrial automation, automobile manufacturing, aerospace and other fields, the market demand for hydraulic springs will continue to grow. At the same time, with the continuous advancement of technology and the continuous expansion of application fields, the market size of hydraulic springs will also expand further.
