Abstracts

A hydraulic torque limiter is a mechanical device that utilizes hydraulic principles to control and limit torque transmission in a mechanical system. It is mainly composed of a hydraulic cylinder, piston, spring, and control valve. When the torque in the mechanical transmission system reaches or exceeds the preset value, the hydraulic pressure in the hydraulic cylinder changes. This causes the piston to move against the force of the spring. As the piston moves, it triggers the control valve to adjust the flow of hydraulic oil, thereby reducing or cutting off the torque transmission to protect the mechanical components from being damaged by excessive torque.

The global Hydraulic Torque Limiter market size was estimated at USD 133.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.60% during the forecast period.
