Report Overview

Hydro-pumped Storage is an altered use of conventional hydropower technology to store and manage energy. Hydro pumped storage projects store electricity by circulating water between an upper and lower reservoir. The electric energy is converted to potential energy and stored in the form of water at an upper elevation. Pumping the water uphill for temporary storage recharges the battery and during periods of high electricity demand the stored water is released back through the turbines and converted back to electricity like a conventional hydropower station.

The increasing demand for energy storage systems and the emergence of ancillary services are two of the primary factors that are driving the global market for hydro-pumped storage plants. It has also been noted that hydro-pumped storage is gaining traction because of the increased importance of grid stability, along with the need for load balancing and energy storage. Moreover, the requirement of alternative energy sources with black start capability, reactive power generation, and an ability to operate as a spinning reserve are other factors that augur well for the future of this market during the forecast period.
