Report Overview

Hydrocarbon Hydrogen Analyzer is a device used to measure the concentration of hydrocarbons in a hydrogen gas stream. It is used in various industries such as oil and gas, chemical, and petrochemical industries to ensure the purity of hydrogen gas used in their processes.

The device works by using a flame ionization detector (FID) to detect the presence of hydrocarbons in the hydrogen gas stream. The FID burns the hydrocarbons in the gas stream and produces ions that are measured by the detector. The concentration of hydrocarbons in the gas stream can then be calculated based on the ion current measured by the detector.
