Abstracts

A hydrocarbon separation unit is a device specially designed to separate and remove hydrocarbons (such as oil, diesel, gasoline, lubricants, etc.) from water. It uses the density difference between hydrocarbons and water, combined with gravity sedimentation, coalescence separation or adsorption technology to separate oil pollutants and prevent them from entering sewers or natural water bodies, thereby reducing the risk of environmental pollution. This equipment is usually equipped with multiple compartments, filter units or adsorption media to improve separation efficiency. Hydrocarbon separation units are widely used in places such as oil refineries, gas stations, industrial emission treatment facilities, and airports. They are particularly suitable for the treatment of oily wastewater and rainwater runoff to ensure that the discharged water quality meets environmental regulations.

The global Hydrocarbon Separation Unit market size was estimated at USD 1484.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.70% during the forecast period.
