## Abstracts

Hydrofluoric Acid Etching Gel for Dental Use is a specialized gel formulation containing a low concentration of hydrofluoric acid (HF), primarily designed for dental treatments. This gel is used in the process of enamel etching, where it creates microscopic pores on the tooth surface, enhancing the bond strength between the tooth enamel and dental restorative materials. By applying the gel to the tooth surface and allowing it to react for a controlled period, dentists can prepare the enamel for better adhesion of composites, veneers, or other dental restorations. The use of hydrofluoric acid etching gel in dentistry allows for more predictable and durable restorations, improving the overall quality and longevity of dental treatments. However, due to the corrosive nature of HF, strict safety protocols must be followed to protect both patients and dental professionals from potential hazards.

The global Hydrofluoric Acid Etching Gel for Dental market size was estimated at USD 156.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.20% during the forecast period.
