Abstracts

Hydrofluoroolefins (HFOs) are a class of synthetic, low-global-warming-potential (GWP) organic compounds developed as fourth-generation replacements for hydrofluorocarbons (HFCs) and other ozone-depleting or high-GWP refrigerants, blowing agents, solvents, and propellants. Characterized by at least one double bond between carbon atoms, HFOs are engineered to break down rapidly in the atmosphere, resulting in significantly reduced climate impact compared to their predecessors, while maintaining performance efficiency in applications such as commercial refrigeration, air conditioning, insulating foams, and aerosol products. Their chemical structure enables a short atmospheric lifetime—often just days—leading to GWPs near or below 1, aligning with global regulatory trends aiming to phase down high-GWP substances under agreements like the Kigali Amendment to the Montreal Protocol.

The global Hydrofluoroolefins (Hfos) market size was estimated at USD 1420.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
