Report Overview

At present, hydrogen circulation systems mainly use hydrogen circulation pumps and ejectors, and both are used simultaneously. In terms of its working principle, the hydrogen circulation pump adopts a motor frequency conversion control motor, which enables the reflux capacity to respond according to different powers, effectively improving hydrogen circulation and high flexibility, but requires additional electricity to maintain its operation. The ejector does not require additional power consumption and has a simple structure, making it reliable and long-lasting. However, its reflux capacity is fixed, so it can only be effective within a certain output power range.

The global Hydrogen Circulation Pump and Ejector market size was estimated at USD 95.60 million in 2023 and is projected to reach USD 1758.05 million by 2032, exhibiting a CAGR of 38.20% during the forecast period.
