Abstracts

A hydrogen circulation system is an essential component of fuel cell applications, primarily used in fuel cell electric vehicles (FCEVs) and stationary power units, designed to recirculate unconsumed hydrogen from the anode outlet back to the inlet to improve fuel efficiency, ensure uniform hydrogen distribution across the fuel cell stack, maintain proper humidity levels, and prevent water accumulation that could impair performance. These systems typically include components such as hydrogen circulation pumps or ejectors, sensors, and control units, and must operate reliably under varying pressure and temperature conditions while meeting strict safety standards to handle hydrogen's flammability and permeability.

The global Hydrogen Circulation System market size was estimated at USD 780.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 14.50% during the forecast period.
