Report Overview

The hydrogen ejector is a hydrogen circulation system and an important part of the fuel cell. The fuel cell relies on the electrochemical reaction of hydrogen and oxygen to generate electricity. During the working process of the fuel cell, the hydrogen ejector provides sufficient hydrogen for the stack to ensure the uniform diffusion of the hydrogen, and recover the hydrogen that did not participate in the reaction. It is provided to the stack to ensure the stable electrochemical reaction of the stack, which is a key component of the passive circulation form of the hydrogen circulation system. The ejector has the advantages of low cost, small size, and no parasitic power, but it has disadvantages such as being unable to achieve full working condition coverage and poor universality.
