Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Hydrogen Fuel Cell Bipolar Plate competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Bipolar Plates are one of the core components of the fuel cells, which accounts for a large portion of the quality and cost of the battery pack. It is responsible for the functions of uniform distribution of reaction gas, conduction of current, and series of single cells. In order to meet these functional requirements, the ideal bipolar plate should have high thermal/electrical conductivity, corrosion resistance, low density, good mechanical properties, low cost, and easy processing. However, the current bipolar plates have problems such as poor corrosion resistance and conductivity, high production costs and short lifespan. Realizing the reasonable matching of the conductivity and corrosion resistance of the bipolar plate material, that is, achieving high corrosion resistance under the premise of ensuring reasonable conductivity, ensuring the service life of the entire system, is one of the key steps in the commercialization of fuel cells. Today, a growing numbers fuel cell buses, trucks and cars are being deployed in the cities. With no emissions at the tailpipe, fuel cell vehicles will play an important role in meeting the air quality improvement goals set by communities. Fuel cell technology has moved beyond the prototype stage, and fuel cell vehicles are now on the road for real-world operation. OEMs and technology providers have an eye towards the future, designing fuel cell engines suitable for mass production volumes. An important fuel cell design consideration is the material selected for the bipolar plate for the proton exchange membrane (PEM) fuel cell. The bipolar (or flow field) plate is a key component, connecting each cell electrically, supplying reactant gases, and removing reaction by-products from the cell. Bipolar plates can be made from various materials, with the most common being graphite carbon or metal. Each type of material has its

strengths and weaknesses. Tradeoffs must be evaluated with the goal of balancing both material performance and cost effective manufacturing processes.

The global Hydrogen Fuel Cell Bipolar Plate market size was estimated at USD 513.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 21.30% during the forecast period.
