Report Overview

A hydrogen-powered aircraft is an aeroplane that uses hydrogen fuel as a power source. Hydrogen can either be burned in a jet engine or another kind of internal combustion engine, or can be used to power a fuel cell to generate electricity to power an electric propulsor. It cannot be stored in a traditional wet wing, and hydrogen tanks have to be housed in the fuselage or be supported by the wing. Hydrogen, which can be produced from low-carbon power and can produce zero emissions, can reduce the environmental impact of aviation.

The global Hydrogen-Powered Aircraft market size was estimated at USD 172 million in 2023 and is projected to reach USD 1689.68 million by 2032, exhibiting a CAGR of 28.90% during the forecast period.
