Abstracts

The market for hydrogen production by coal, often referred to as brown or gray hydrogen depending on the specific process and carbon management approach, involves generating hydrogen through coal gasification—a thermochemical process where coal reacts with steam and oxygen under high pressure and temperature to produce syngas, which is then purified to extract hydrogen. This method is historically significant due to the abundance and low cost of coal in many regions, particularly in countries like China, the United States, and India, where it has been a cornerstone of industrial hydrogen supply for applications such as ammonia production, refining, and methanol synthesis. Despite its economic advantages in terms of feedstock availability and established infrastructure, the market faces growing scrutiny and regulatory pressure due to its high carbon intensity, as the process releases substantial CO₂ emissions unless coupled with carbon capture, utilization, and storage (CCUS) technologies—leading to a emerging subsegment focused on blue hydrogen (coal-based with CCUS) to align with global decarbonization goals. Market dynamics are increasingly influenced by energy transition policies, carbon pricing mechanisms, competition from lower-emission alternatives like green hydrogen (from renewables), and advancements in gasification and carbon capture efficiency, shaping both the decline of traditional coal-based hydrogen and the potential evolution toward cleaner coal-derived hydrogen pathways in specific geographies with carbon constraints and coal-dependent energy systems.

The global Hydrogen Production By Coal market size was estimated at USD 162.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
